Detectable GW in LVK

Inspiral GWs

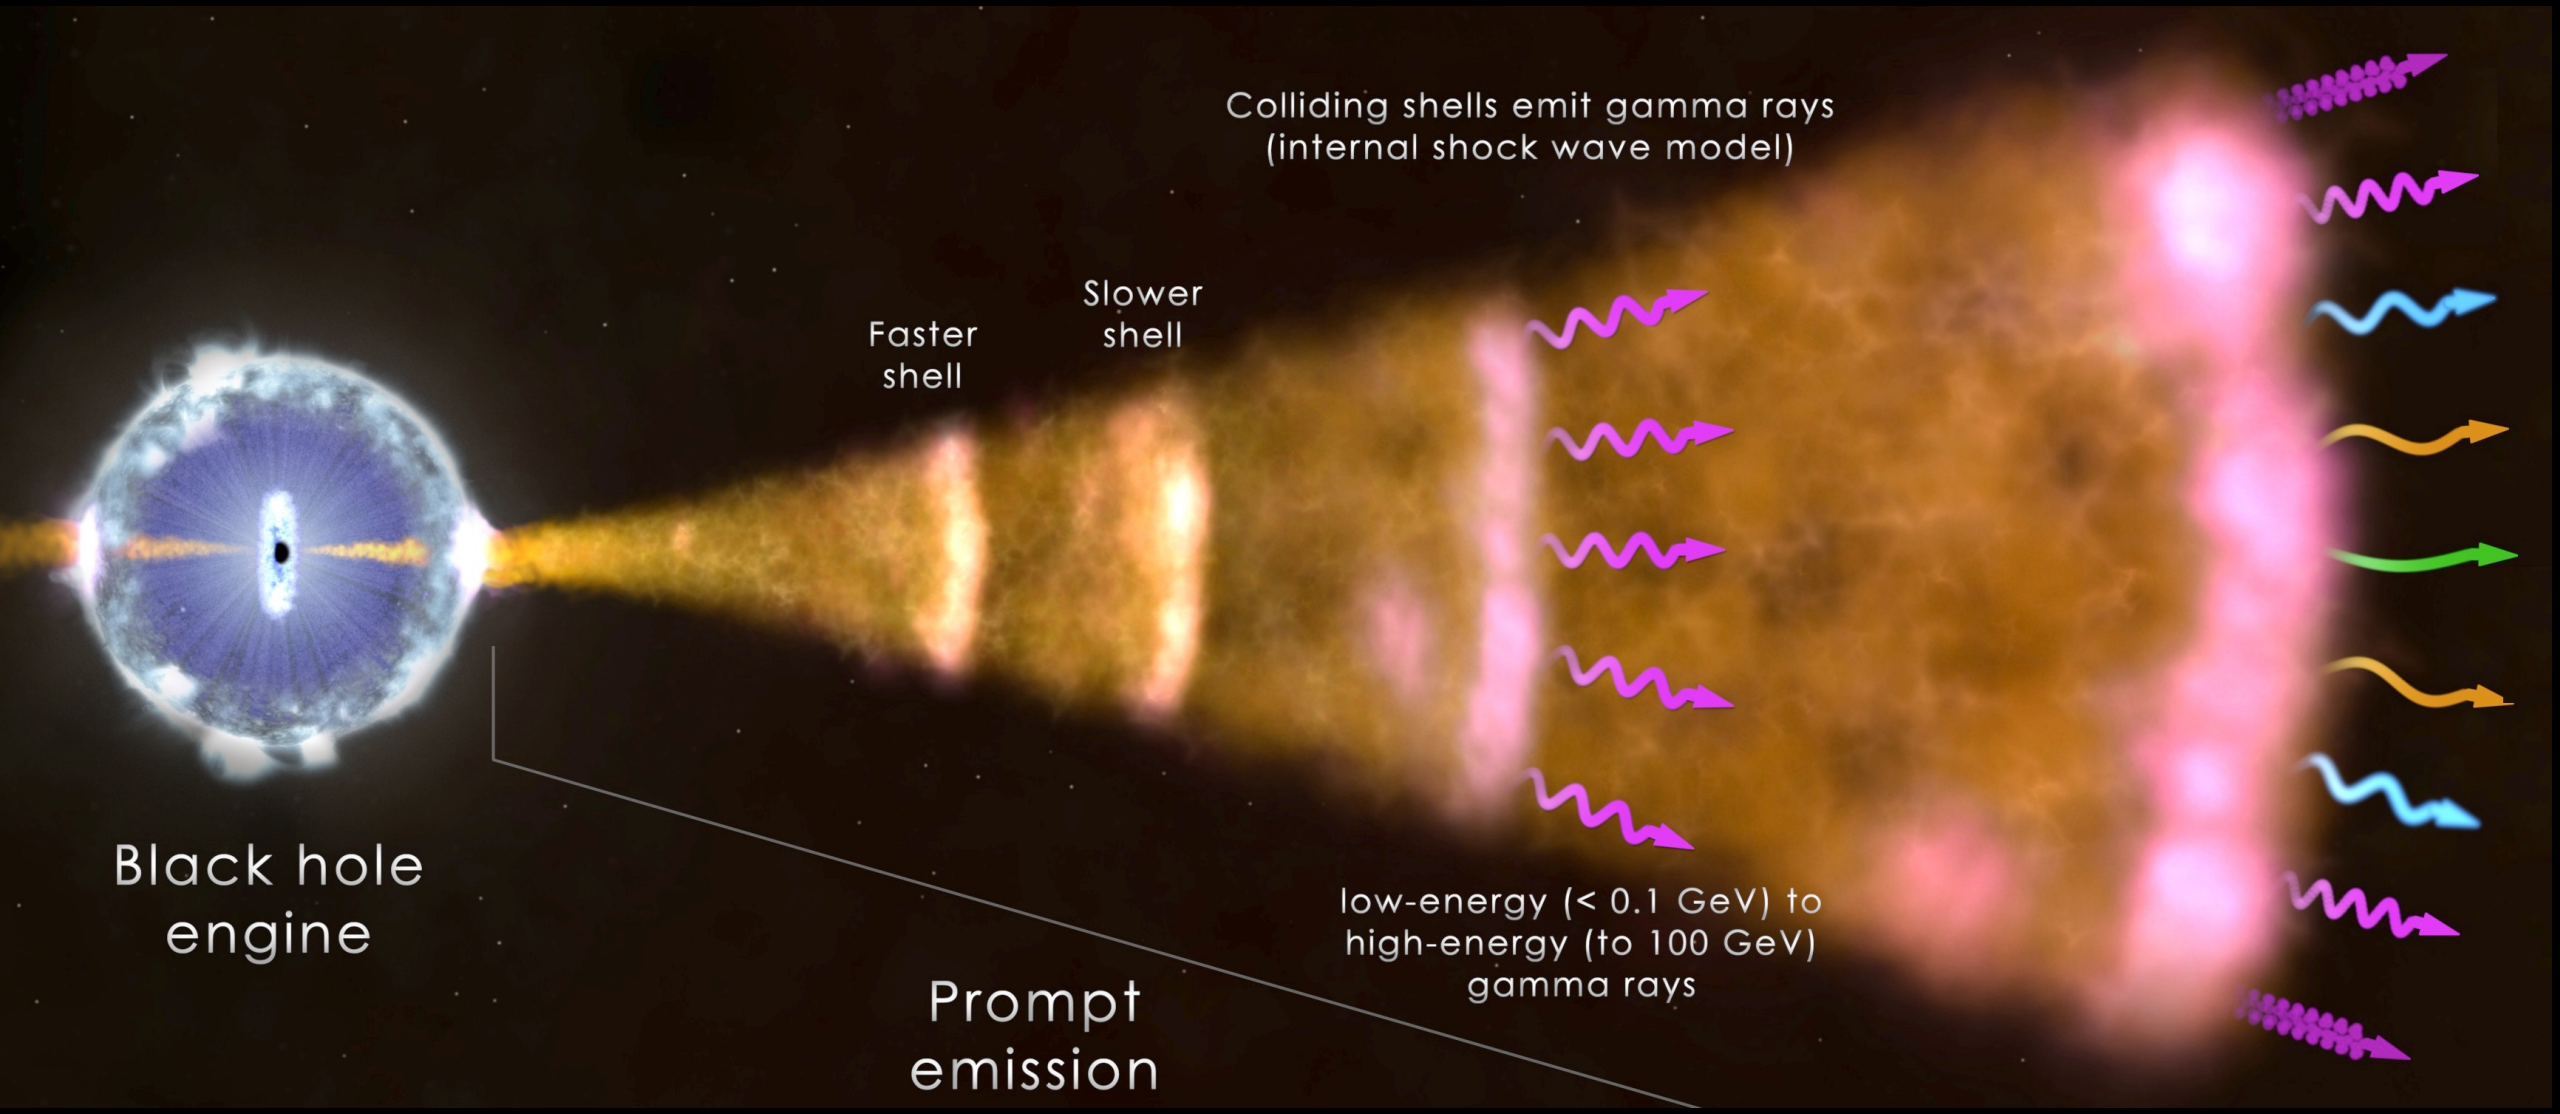
Binary black holes

Black hole-neutron star

Stochastic GWs

Supernovae?

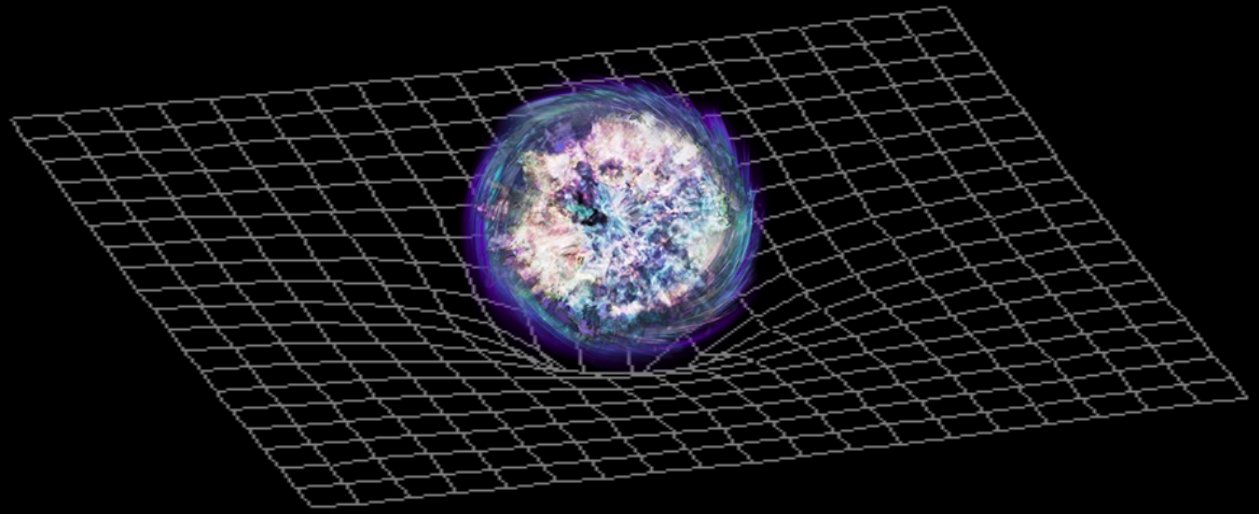
Collapsars



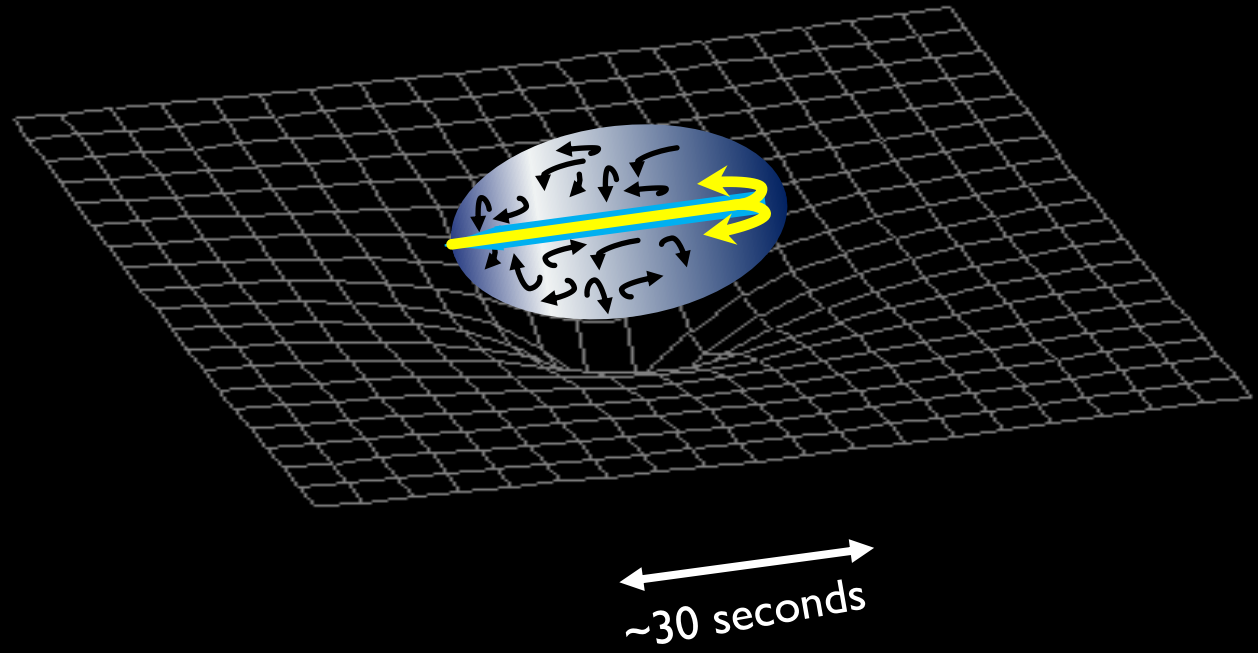
Colliding shells emit gamma rays
(internal shock wave model)
Faster shell
Slower shell
Black hole engine
Prompt emission
low-energy (< 0.1 GeV) to high-energy (to 100 GeV) gamma rays

Stochastic gravitational waves

- Supernova - too weak



- GRB jets - $f_{GW} \approx 0.03$ Hz – too low for LVK

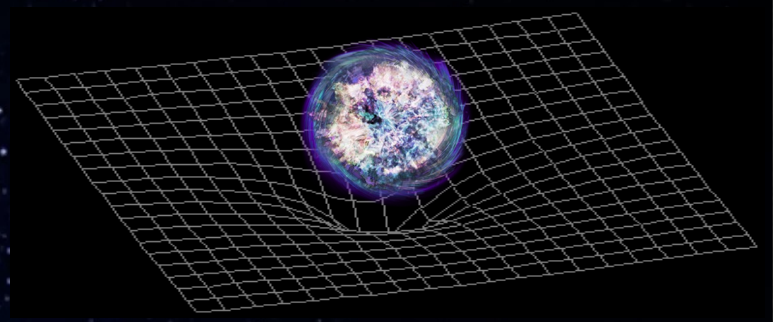


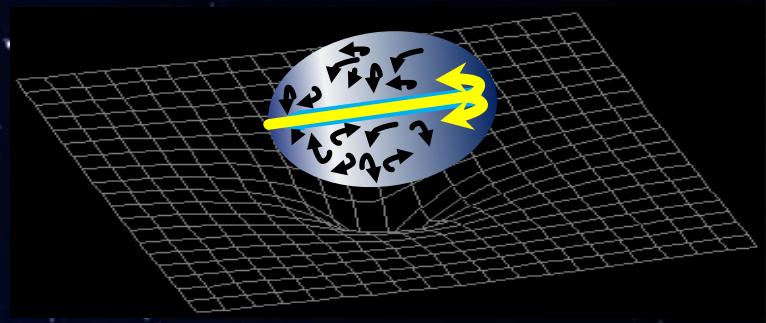
Dancing jets

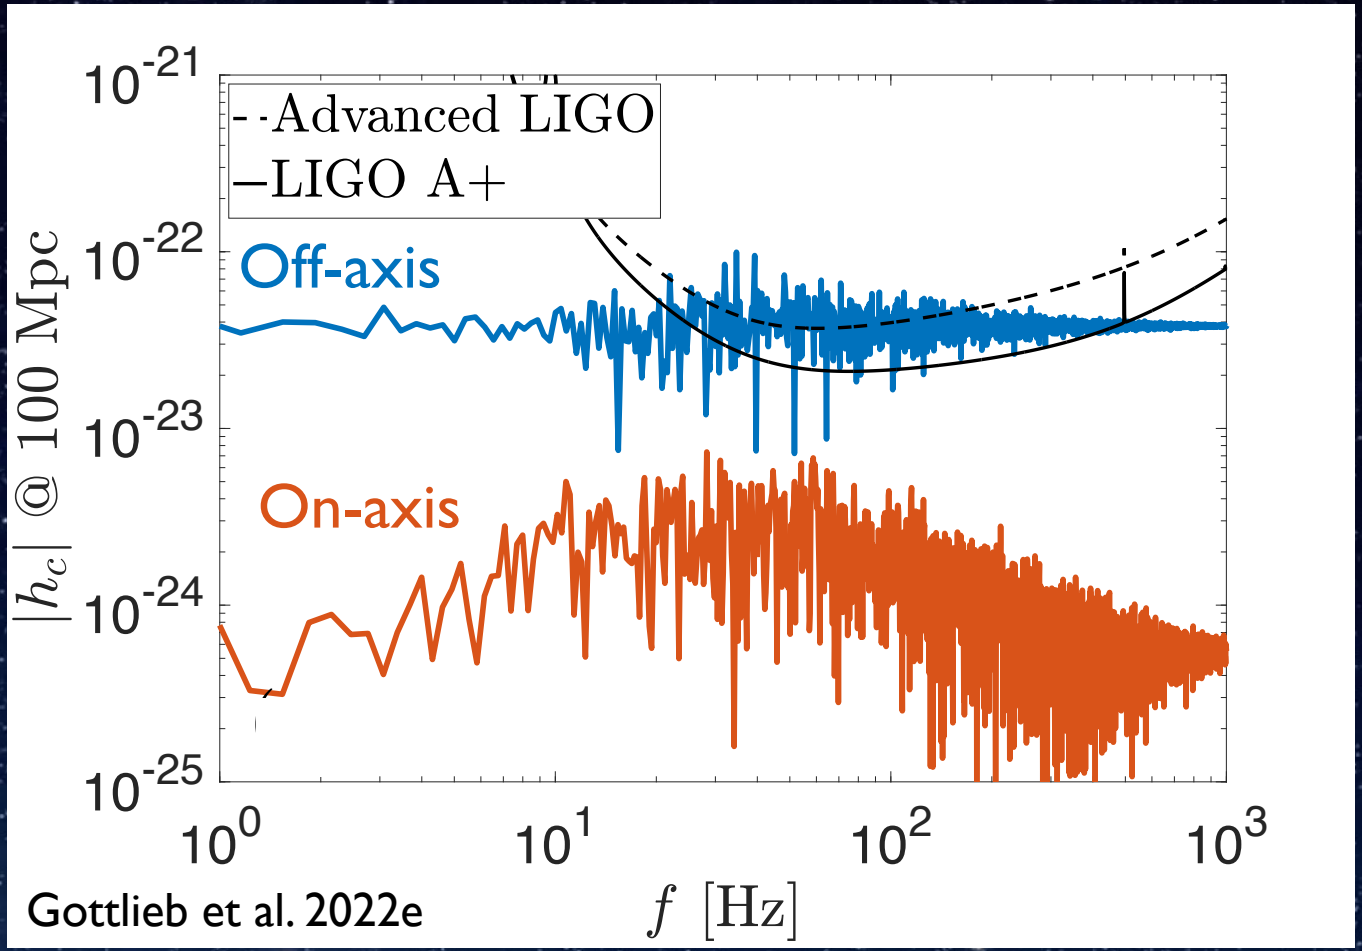
Gottlieb et al. 2022c

Multi-messenger cocoons

- ✓ Shape: hourglass
- ✓ Frequency: fast evolution
- ✓ Energy: comparable with jets and SNe
- ➢ Promising multi-messenger source







Gottlieb et al. 2022e

Summary

- Cocoons are the most promising stochastic GW sources in LVK known to date
- Cocoons are promising multi-messenger sources
- EM detection from cocoons will aid the GW detection prospects
- Numerical and analytic works are needed to constrain the physics
